CONFORMANCE STATEMENT OVERVIEW

The **ACUSON SC2000™ Volume Imaging Ultrasound System** supports the following DICOM Application Entities:

- Verification
  - o Verification AE
- Transfer
  - o Storage AE
  - o Storage Commitment AE
- Query / Retrieve
  - o Query AE
  - o Retrieve AE
- Workflow Management
  - o Worklist AE
  - o MPPS AE

1 INTRODUCTION

This document describes the conformance to the ACR-NEMA DICOM 3.0 Standard by the ACUSON SC2000™ volume imaging ultrasound system, version VA15A from Siemens Healthcare. It shall establish the conformance specifications for this system only, and does not apply to other products offered by Siemens Healthcare or its affiliates.

The ACUSON SC2000 system is a device that generates ultrasound images that can be sent using DICOM standard protocols and definitions to other DICOM compliant devices that support SOP classes as defined in Table 2-1: SOP Classes for Storage AE in this document.

The DICOM standard provides a well-defined set of structures and protocols that allow inter-operability of a wide variety of medical imaging devices. The ACUSON SC2000 system provides support for essential services related to ultrasound scanning and connectivity to DICOM compliant devices. ACUSON SC2000 systems will not support all features supported by the DICOM standard. This document clearly states the DICOM services and data classes that are supported by the applications included with the ACUSON SC2000 system. The intent of this document is to allow users and other vendors who also conform to the DICOM standard to exchange information within the specific context of those elements of the DICOM standard that the ACUSON SC2000 system supports.

This document is written with respect to the adopted portions of the DICOM standard, Version 3. The following sections of this document follow the outline specified in the DICOM Standard NEMA publication PS3.2.[1]

1.1 Audience

This document is written for the people that need to understand how the ACUSON SC2000 system will integrate into their healthcare facility. This includes both those responsible for overall imaging network policy and architecture, as well as integrators who need to have a detailed understanding of the DICOM features of the product. This document contains some basic DICOM definitions so that any reader may understand how this product implements DICOM features. However, integrators are expected to fully understand all the DICOM terminology, how the tables in this document relate to the product's functionality, and how that functionality integrates with other devices that support compatible DICOM features.

1.2 Remarks

The scope of this DICOM Conformance Statement is to facilitate integration between the ACUSON SC2000 system and other DICOM products. The Conformance Statement should be read and understood in conjunction with the DICOM Standard.

DICOM, by itself, does not guarantee interoperability. However, the Conformance Statement facilitates a first-level validation for interoperability between different applications supporting the same DICOM functionality as SCU and SCP, respectively.

This Conformance Statement is not intended to replace validation with other DICOM equipment to ensure proper exchange of information intended.

The scope of this Conformance Statement is to facilitate communication with Siemens and other vendors' Medical equipment. The Conformance Statement should be read and understood in conjunction with the DICOM 3.0 Standard [1]. However, by itself it is not guaranteed to ensure the desired interoperability and a successful interconnectivity.

The user should be aware of the following important issues:

- The comparison of different conformance statements is the first step towards assessing interconnectivity.
- Test procedures should be defined and tests should be performed by the user to validate the connectivity desired. DICOM itself and the conformance parts do not specify this.
- The standard will evolve to meet the users' future requirements. Siemens is actively involved in developing the standard further and therefore reserves the right to make changes to its products or to discontinue its delivery.

Siemens reserves the right to modify the design and specifications contained herein without prior notice. Please contact your local Siemens representative for the most recent product information.

1.3 Terms and Definitions

Informal definitions are provided for the following terms used in this Conformance Statement. The DICOM Standard is the authoritative source for formal definition of these terms.

Abstract Syntax – The information agreed to be exchanged between applications, generally equivalent to a Service/Object Pair (SOP) Class. Examples: Verification SOP Class, Modality Worklist Information Model Find SOP Class, Computed Radiography Image Storage SOP Class.

ACUSON SC2000™ system – The volume imaging ultrasound system of this conformance statement; also referred to as the SC2000.

Application Entity (AE) – An end point of a DICOM information exchange, including the DICOM network or media interface software; i.e., the software that sends or receives DICOM information objects or messages. A single device may have multiple Application Entities.

Application Entity Title – The externally known name of an *Application Entity*, used to identify a DICOM application to other DICOM applications on the network.

Application Context – The specification of the type of communication used between *Application Entities*. Example: DICOM network protocol.

Association – A network communication channel set up between *Application Entities*.

Attribute – A unit of information in an object definition; a data element identified by a *tag*. The information may be a complex data structure (Sequence), itself composed of lower level data elements. Examples: Patient ID (0010,0020), Accession Number (0008,0050), Photometric Interpretation (0028,0004), Procedure Code Sequence (0008,1032).

Attribute Macro - A set of Attributes that are described in a single table that is referenced by multiple Module or other tables.

Information Object Definition (IOD) – A data abstraction of a class of similar Real-World Objects which defines the nature and attributes relevant to the class of Real-World objects represented. Examples: MR Image IOD, CT Image IOD, Print Job IOD.

Integrating the Healthcare Enterprise (IHE) – An initiative sponsored by the Radiological Society of North America (RSNA) to document and demonstrate standards-based methods of sharing information in support of optimal patient care. For additional information, see www.rsna.org/ihe.

Functional Group - A set of logically related Attributes that are likely to vary together. May be used in Multi-frame IODs to describe parameters which change on a per frame basis.

Joint Photographic Experts Group (JPEG) – Joint Photographic Experts Group, The group was organized in 1986, issuing a standard in 1992, which was approved in 1994 as ISO 10918-1. The JPEG standard is used by DICOM applications.

Media Application Profile – The specification of DICOM information objects and encoding exchanged on removable media (e.g., CDs), see DICOM PS3.11.

Module – A set of *Attributes* within an *Information Object Definition* that are logically related to each other. Example: Patient Module includes (among others) Patient Name, Patient ID, Patient Birth Date, and Patient Sex.

Negotiation – First phase of *Association* establishment that allows *Application Entities* to agree on the types of data to be exchanged and how that data will be encoded.

Picture Archiving and Communications Systems (PACS) – A DICOM server that accepts medical images from another DICOM system and stores the images for later retrieval.

Presentation Context – The set of DICOM network services used over an *Association*, as negotiated between *Application Entities*; includes *Abstract Syntaxes* and *Transfer Syntaxes*.

Protocol Data Unit (PDU) – A packet (piece) of a DICOM message sent across the network. It contains protocol control information and user data. Devices must specify the maximum size packet they can receive for DICOM messages.

Request (RQ) – A request from one DICOM AE for service from another DICOM AE.

Response (RSP) – A response from one DICOM AE to the request for service from another DICOM AE.

Security Profile – A set of mechanisms, such as encryption, user authentication, or digital signatures, used by an *Application Entity* to ensure confidentiality, integrity, and/or availability of exchanged DICOM data.

Service Class Provider (SCP) – The role of an *Application Entity* that provides a DICOM network service; typically, a server that performs operations requested by another *Application Entity* (*Service Class User*). Examples: Picture Archiving and Communication System (image storage SCP, and image query/retrieve SCP), Radiology Information System (modality worklist SCP).

Service Class User (SCU) – The role of an *Application Entity* that uses a DICOM network service; typically, a client. Examples: imaging modality (image storage SCU, and modality worklist SCU), imaging workstation (image query/retrieve SCU).

Service/Object Pair (SOP) Class – The specification of the network or media transfer (service) of a particular type of data (object); the fundamental unit of DICOM interoperability specification. Examples: Ultrasound Image Storage Service, Basic Grayscale Print Management.

Service/Object Pair (SOP) Instance – An information object; a specific occurrence of information exchanged in a *SOP Class*. Examples: a specific x-ray image.

Structured Report (SR) – A DICOM object which contains measurement, calculations, diagnoses, image references, and other non-image information concerning a patient exam.

***syngo*® SC2000™ Workplace** – The workplace used with the ACUSON SC2000 system; also referred to as the SC2000 Workplace.

Tag – A 32-bit identifier for a data element, represented as a pair of four digit hexadecimal numbers, the "group" and the "element". If the "group" number is odd, the tag is for a private (manufacturer-specific) data element. Examples: (0010,0020) [Patient ID], (07FE,0010) [Pixel Data], (0019,0210) [private data element].

Transfer Syntax – The encoding used for exchange of DICOM information objects and messages. Examples: *JPEG* compressed (images), little endian explicit value representation.

Unique Identifier (UID) – A globally unique "dotted decimal" string that identifies a specific object or a class of objects; an ISO-8824 Object Identifier. Examples: Study Instance UID, SOP Class UID, SOP Instance UID.

Value Representation (VR) – The format type of an individual DICOM data element, such as text, an integer, a person's name, or a code. DICOM information objects can be transmitted with either explicit identification of the type of each data element (Explicit VR), or without explicit identification (Implicit VR); with Implicit VR, the receiving application must use a DICOM data dictionary to look up the format of each data element.

1.4 Basics of DICOM Communication

This section describes terminology used in this Conformance Statement for the non-specialist. The key terms used in the Conformance Statement are highlighted in *italics* below. This section is not a substitute for training about DICOM, and it makes many simplifications about the meanings of DICOM terms.

Two *Application Entities* (devices) that want to communicate with each other over a network using DICOM protocol must first agree on several things during an initial network "handshake". One of the two devices must initiate an *Association* (a connection to the other device), and ask if specific services, information, and encoding can be supported by the other device (*Negotiation*).

DICOM specifies a number of network services and types of information objects, each of which is called an *Abstract Syntax* for the Negotiation. DICOM also specifies a variety of methods for encoding data, denoted *Transfer Syntaxes*. The Negotiation allows the initiating Application Entity to propose combinations of Abstract Syntax and Transfer Syntax to be used on the Association; these combinations are called *Presentation Contexts.* The receiving Application Entity accepts the Presentation Contexts it supports.

For each Presentation Context, the Association Negotiation also allows the devices to agree on *Roles* – which one is the *Service Class User* (SCU - client) and which is the *Service Class Provider* (SCP - server). Normally the device initiating the connection is the SCU, i.e., the client system calls the server, but not always.

The Association Negotiation finally enables exchange of maximum network packet (*PDU*) size, security information, and network service options (called *Extended Negotiation* information).

The Application Entities, having negotiated the Association parameters, may now commence exchanging data. Common data exchanges include queries for worklists and lists of stored images, transfer of image objects and analyses (structured reports), and sending images to film printers. Each exchangeable unit of data is formatted by the sender in accordance with the appropriate *Information Object Definition*, and sent using the negotiated Transfer Syntax. There is a Default Transfer Syntax that all systems must accept, but it may not be the most efficient for some use cases. Each transfer is explicitly acknowledged by the receiver with a *Response Status* indicating success, failure, or that query or retrieve operations are still in process.

Two Application Entities may also communicate with each other by exchanging media (such as a CD-R). Since there is no Association Negotiation possible, they both use a *Media Application Profile* that specifies “pre-negotiated” exchange media format, Abstract Syntax, and Transfer Syntax.

2 NETWORKING

This section contains the ACUSON SC2000 system networking related services.

2.1 Implementation Model

SC2000 users can store images directly on the system hard drive. Images can also be transferred to DICOM workstations and archive servers on a network. Storage Commitment can be used to insure that patient images and data is safely committed. Measurements from Cardiac exams can be exported as DICOM SR Objects. The system is capable of querying a HIS/RIS, using DICOM Basic Worklist Management Service, for a list of scheduled patient procedures. Measurements from Cardiac exams can be exported as DICOM SR Objects. Performed procedure status and other procedure information can be returned to the HIS/ RIS using Modality Performed Procedure Step (MPPS).

SC2000 Real World Activities are indicated by “Real World Activity” name while “SC2000 AE” indicates the invoked Application Entity. Similarly, the activities associated with service providers are indicated as “Real World Service Activity.”

2.1.1 Application Data Flow

Figure 2-1 and Figure 2-2 provide a functional overview of the SC2000’s Application Entities (AE). Relationships are shown between user-invoked activities (in the circles at the left of the AEs) and the associated real-world activities provided by DICOM service providers (in the circles at the right of the AEs).

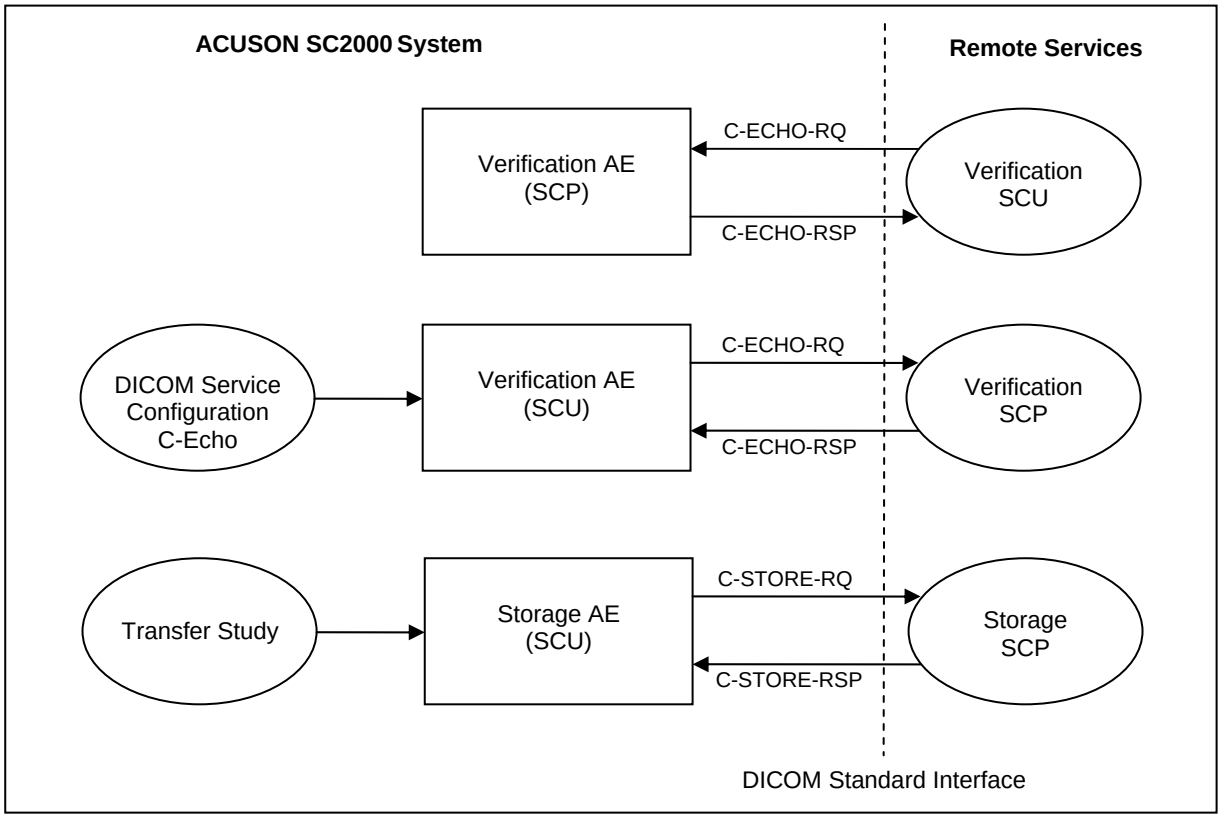

Figure 2-1. Functional Overview

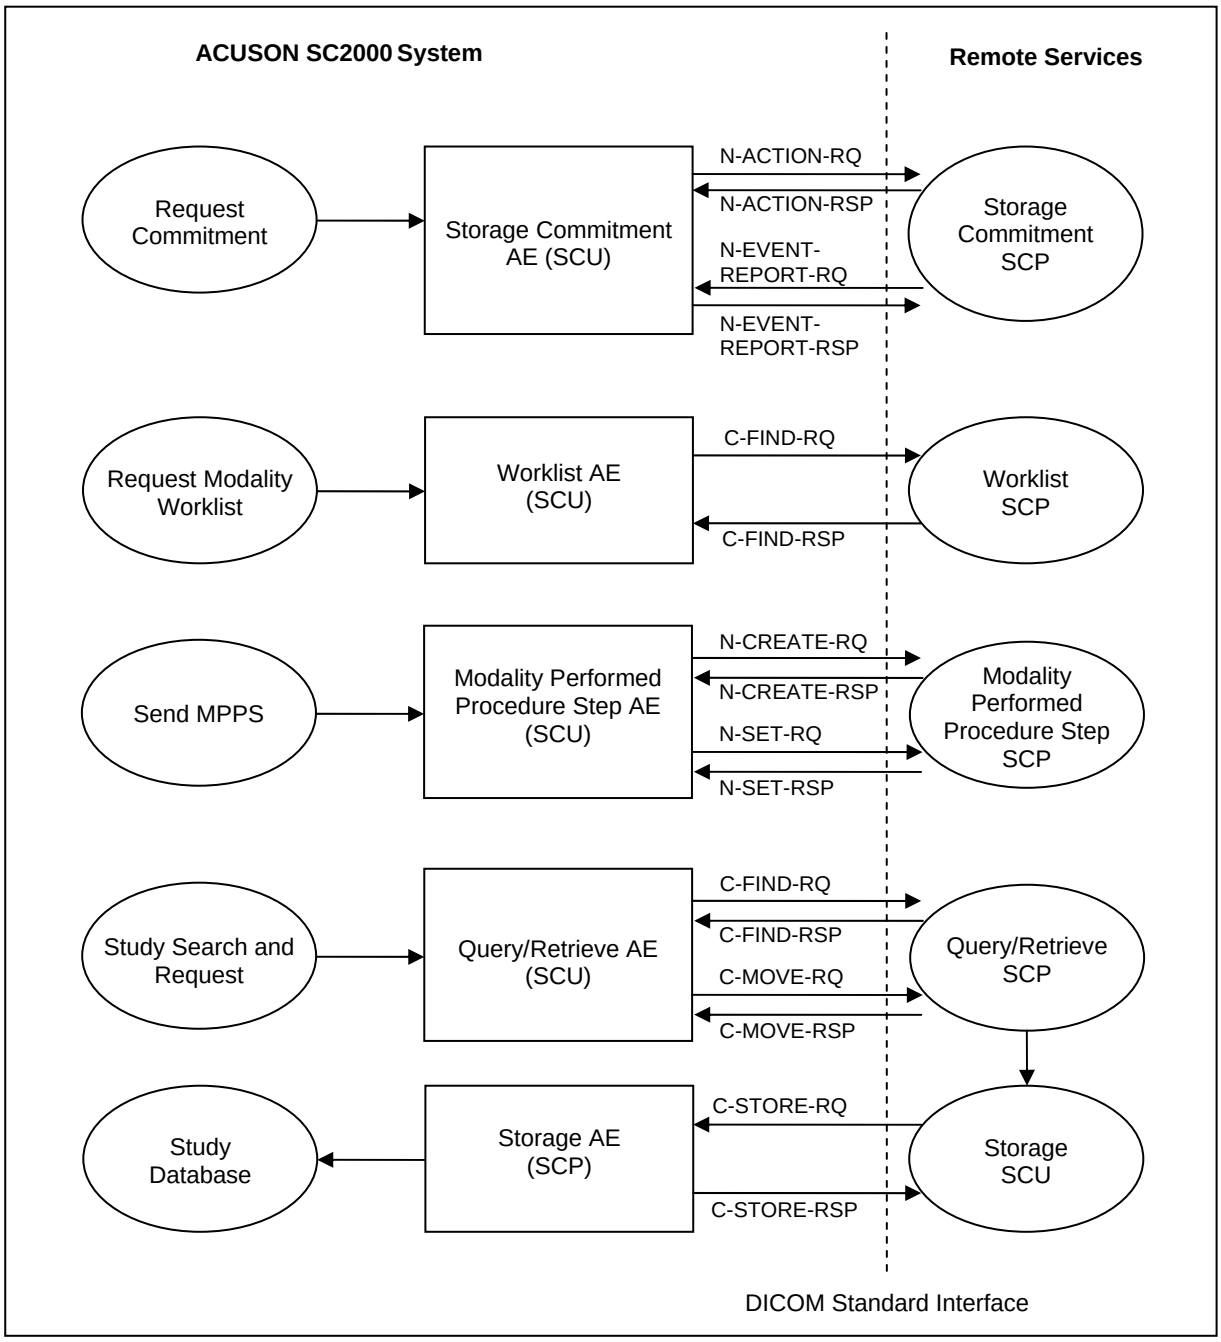

Figure 2-2. Functional Overview (Continued)

2.1.2 Functional Definition of AE's

The SCP components of the SC2000 operate as background server processes. They exist as soon as the system is powered up and wait for association requests. Upon accepting an association with a negotiated Presentation Context they start to receive and process the request described in the following sections.

2.1.2.1 Verification AE

The DICOM verification service can be used for diagnostic purposes. When used as a diagnostic tool, Verification will return the following messages to the user:

- C-Echo discovery result: Succeeded
- C-Echo discover result: Failed

Verification is available for each service configuration accessed through the Network/Printing pages of User Configuration:

- Store Configuration
- Storage Commitment Configuration
- Query Retrieve Configuration
- RIS Server Configuration (for Modality Worklist)

The SC2000 supports the Verification service as a SCP and SCU. As a SCU, Verification is activated when the C-Echo button is selected on a service configuration page.

2.1.2.2 Storage AE

The SC2000 acts as SCU and SCP for the C-STORE DICOM network service.

As an SCU, the SC2000 Storage Application Entity originates associations for transfer of DICOM Ultrasound single frame images, multi-frame images, raw data objects, and Comprehensive Structured Reports to remote Application Entities.

The system supports automatic and manual storage of captured objects. Manual transfers can be initiated through the export dialog on the Data View UI. If configured for automatic transfer, the system can either transfer objects “in progress” or “on study close”:

- The system automatically stores an image as soon as it is captured and saved to the local disk while the study is currently open and in-progress.
- The system automatically stores all the images belonging to the current study as it closes.
- The system automatically stores one or more studies in the background, acquired while in a portable non-networked mode, once it is powered up on the network.

The “in-progress” method distributes the network load over time and can provide image review at the review station in near real-time, provided the server supports this capability.

Note: Even when in-progress” method is configured, the system stores the SR objects only at end of study.

The “on study close” method lets the user store studies more accurately in the server. It is a common practice in Ultrasound to delete some images or modify demographic data before the study is closed.

In the event that the SC2000 is taken off the network as a portable system or when a network failure occurs during a background store, the Storage SCU maintains a queue of failed C-STORE requests. These are periodically retried subsequent to the end of the study. The queue is also retried upon power cycling of the SC2000.

The storage request consists of data describing the composite image objects selected for storage and the destination AET. An association is negotiated with the destination AE and the image data is transferred using the C-STORE DIMSE Service. The transfer status is reported to the initiator of the Storage request.

As an SCP, the SC2000 Application Entity accepts storage requests from configured DICOM nodes and stores received objects into the local database. The C-STORE DIMSE service is used for storing the images.

2.1.2.3 Storage Commitment AE

The SC2000 serves as a SCU for the DICOM Storage Commitment service. Upon successful completion of a storage job, the system uses the N-ACTION DIMSE Service to request storage commitment from a DICOM storage SCP. This can either be the same as the storage destination or storage commitment can be requested from a different server depending on the system configuration.

The user configures Storage Commitment from the Networking/Printing pages of the User Configuration. The SC2000 requests commitment of images and structured reports and, upon successful acknowledgement from the storage server, marks the study on the system hard drive as ”Archived” (AD). Storage Commitment Request is always sent in an additional Association.

2.1.2.4 Worklist AE

Patient registration can be automated by using the “Worklist” Real World Activity. Initiating the ‘New Patient’ function begins the patient data registration process and closes the previous active study. The worklist query runs in the background and the system will attempt to find all scheduled ultrasound patients. If no matches are found, a message will be presented to the user indicating so. If more than one matching patient is found, a list of matching entries will be presented to the user. Each of the fields will be sortable in ascending or descending order.

The user will have the option of selecting a patient study or canceling the operation. Selection of a patient from the list will cause all demographic information for that patient to be loaded in the patient registration screen.

2.1.2.5 Modality Performed Procedure Step AE

The SC2000 Modality Performed Procedure Step (MPPS) uses the DICOM 3.0 MPPS service class SCU to send event transactions that facilitate the transfer of procedure status and billing information from the ultrasound system to the information system. MPPS is triggered at the start of a study and at the end of a study. MPPS is also triggered when a study is restarted.

The MPPS SCU supports both the N-CREATE and N-SET DIMSE Service Elements. A different MPPS server can be configured separately from a Modality Worklist server.

2.1.2.6 Query/Retrieve AE

The query/retrieve service class defines an application-level class of services which facilitates the management of images and patient data against the well-defined information model of DICOM and allows a DICOM AE to retrieve images from a remote DICOM node or to request a remote DICOM AE to initiate a transfer of images to another DICOM AE. The SC2000 DICOM query/retrieve application supports the query/retrieve services as an SCU.

The Query SCU initiates a C-FIND request to the remote SCP and is invoked directly by the user, using the query parameters entered in the Data View UI. The remote SCP returns a list of responses with defined data, which are displayed to the user. The user can decide to start retrieval or to issue another query.

The SC2000 supports

- Study Root Query Model.

As the Move SCU, the system initiates a C-MOVE request to the remote Retrieve SCP. The remote Retrieve SCP in turn starts C-STORE suboperations to the Storage SCP.

2.1.3 Sequencing of Real-World Activities

This section describes the sequencing of Real-World Activities performed by the Application Entities using a UML sequence diagram. Real-World Activities are depicted as vertical bars and arrows show the events exchanged between them.

2.2.1.2.3 Asynchronous Nature

The SC2000 supports asynchronous communication (multiple outstanding transactions over a single association). On the SCU side, the Window size proposed is infinite. On the SCP side, any non-infinite maximum size will be accepted.

2.2.1.3 Association Initiation Policy (Storage SCU)

The SC2000 initiates associations while processing the service operations and internal messages as shown below.

Operation or Real-World Activity	Association for
Send Instance	C-STORE, C-ECHO

2.2.1.3.1 Activity "Send To"

2.2.1.3.1.1 Description and Sequencing of Activities

Storage of a DICOM object to an external entity is triggered by a C-STORE request initiated either automatically by the system or interactively (manually) by the user.

If an association to a remote Application Entity could successfully be established, each image will be transferred one after another via the same open association.

The automatic retry mechanism is configurable. The user can configure the number of retries as well as the time interval between two retries.

Retry is done if:

a) The network connection has been lost from the SCU perspective. In this case, retry is performed as soon as the network connection is available again.

b) The partner is not reachable for other reasons (e.g. partner node has broken down). For this case, a (global, configurable) timeout has been implemented after which retry is performed.

2.2.1.3.1.2 Proposed Presentation Contexts

For all supported images (see SOP Classes in Table 2-1: SOP Classes for Storage AE), the following Transfer Syntaxes are supported.

Table 2-7:

2.2.1.3.1.4 SOP Specific Conformance to SOP Classes

The SC2000 will not add or change private attributes, even if case objects are compressed or the image header is updated according to IHE [2] Patient Information Reconciliation.

Refer to section 6.1.1, Created SOP Instances, for a detailed list of attributes.

DICOM Command Communication Failure Behavior

Exception	Behavior
Timeout	Failure reported to user (Timeout configurable; default 30s). The system retries according to the configured retry parameters.
Association Aborted	Failure reported to user and the storage job is cancelled.

2.2.1.4 Association Acceptance Policy

The SC2000 attempts to accept a new association for

- DIMSE C-STORE

service operations.

Generally, associations are accepted if all of the following conditions are true:

- The "called AET" matches one of the configured Application Entity Titles of the SC2000.
- The "calling AET" is allowed to connect to SC2000. This check can be disabled.
- The maximum number of incoming associations is not reached.
- At least one Proposed Presentation Context is supported.

If a Proposed Presentation Context contains more than one Transfer Syntax, the one in the following priority list is chosen (if applicable for the SOP class):

1) Explicit Value Representation Little Endian
2) Implicit Value Representation Little Endian
3) Explicit Value Representation Big Endian
4) JPEG Baseline (Process 1)
5) JPEG Extended (Process 2 & 4)
6) JPEG Lossless, Non-Hierarchical, First-Order Prediction (Process 14)
7) JPEG 2000 Image Compression (Lossless Only)
8) JPEG 2000 Image Compression
9) RLE Lossless

2.2.1.4.1 Activity "Receive Instances"

2.2.1.4.1.1 Description and Sequencing of Activities

The SC2000 receiving process will accept an association, receive any images transmitted on that association and store the images on disk. It will store some header attributes in the database in order to allow clients to query these attributes.

2.2.1.4.1.2 Accepted Presentation Contexts

1.2.840.10008.1.2.2	Explicit Value Representation Big Endian
1.2.840.10008.1.2.1	Explicit Value Representation Little Endian
1.2.840.10008.1.2	Implicit Value Representation Little Endian: Default Transfer Syntax for DICOM
1.2.840.10008.1.2.4.91	JPEG 2000 Image Compression
1.2.840.10008.1.2.4.90	JPEG 2000 Image Compression (Lossless Only)
1.2.840.10008.1.2.4.50	JPEG Baseline (Process 1): Default Transfer Syntax for Lossy JPEG 8 Bit Image Compression
1.2.840.10008.1.2.4.51	JPEG Extended (Process 2 & 4): Default Transfer Syntax for Lossy JPEG 12 Bit Image Compression (Process 4 only)
1.2.840.10008.1.2.4.70	JPEG Lossless, Non-Hierarchical, First-Order Prediction (Process 14 [Selection Value 1]): Default Transfer Syntax for Lossless JPEG Image Compression
1.2.840.10008.1.2.5	RLE Lossless

2.2.1.4.1.3 SOP Specific Conformance to SOP Classes

In case of a successful C-STORE operation, the image has successfully been written on disk either in Explicit Little Endian format or in the compression format received.

The Storage AE of the SC2000 returns the status "success" when the data is stored to disk and a minimal image header validation has been performed.

The following header attributes must be available and filled:

- Patient Name,
- Study Instance UID,
- Series Instance UID and
- SOP Instance UID

Table 2-11:
Storage C-STORE Response Status

Service Status	Further Meaning	Error Code	Reason
Success	Success	0x0000	Image received correctly (success notification is done after receiving, before indexing and storing)

2.2.1.4.1.4 Other SOP Specific Behavior

- If an image is received that is already stored in the database – identified by the SOP Instance UID – the new image will be ignored. The existing instance is not superseded.
- The Patient Quadruplet (Patient's Name, Patient ID, Date of Birth, Patient Sex) is internally used for unique identification. The Patient ID is specified as a "type 2" attribute by DICOM. Therefore the attribute must be in the message but it may be empty. If the Patient ID is missing, it will be generated and inserted to the index by the SC2000 for internal purposes.

Operation or Real-World Activity	Association for
Storage Commitment	N-ACTION N-EVENT-REPORT

2.2.2.3.1 Activity "Send Initial Storage Commitment"

2.2.2.3.1.1 Description and Sequencing of Activities

After Sending Images to the Archive, the SC2000 will initiate a Storage Commitment request if configured. The SC2000 initiates a new association in order to send the N-ACTION-RQ to the SCP.

2.2.3.3 Association Initiation Policy (Query SCU)

The SC2000 will initiate new associations for the following operations as an SCU.

Operation or Real–World Activity	Association for
Querying a Remote Node	C-FIND

2.2.3.3.1 Activity "Querying a Remote Node"

2.2.3.3.1.1 Description and Sequencing of Activities

The associated Real-World activity is a C-Find request initiated by the user of the SC2000. The user specifies some attributes the system should use to query its database. If the query user successfully establishes an association to the remote Application Entity, it will send a C-Find request (according to the query model) and will then return the results to the application.

2.2.3.3.1.2 Proposed Presentation Contexts

The SC2000 will propose Presentation Contexts as shown in the following table.

Table 2-29:

2.2.5.3.1.3 SOP Specific Conformance to Modality Worklist Service SOP Class

The following table provides the list of user configurable matching attributes requested in the Broad Query of the Modality Worklist (C-FIND).
The broad query C-FIND-RQ is populated from the RIS Server configuration parameters. The broad query is always an automatic query, which is initiated by the system at intervals defined by the user, in the RIS Server configuration.

Table 2-48:
Modality Worklist Matching Key Attributes (Broad Query)

RIS Server Configuration	Attribute Name	Tag	Query Value

Modality	>Modality	(0008,0060)	"US" or <blank>

The following table provides the list of user configurable matching attributes requested in the Patient based Query of the Modality Worklist (C-FIND).
The patient based query C-FIND-RQ is populated from the query parameters specified for a particular RIS server on SC2000 Data View. The patient based query is interactively (manually) initiated by the user, after selecting the RIS server from the Data view "look in" drop down field and populating at least one of the Worklist Data View fields defined in the table below.

Table 2-49:

Return Key Attributes used from the Worklist C_FIND_RSP

The ACUSON SC2000 system DICOM worklist SCU supports worklist queries with return key attributes of all types. The following table describes the return keys that the SCU supports or are needed to display the results on the Worklist view. Most attributes can be shown in the User Interface; Patient Registration or Data View. Attributes displayed on the Data View are configurable.

Note: SC2000 system will not display any of the query results, if even one of the results does not conform to the "Return Key Type" column, in the table below.

2.2.5.4 Association Acceptance Policy

Worklist AE does not accept Association requests.

2.2.6 MPPS AE

2.2.6.1 SOP Classes

This Application Entity provides Standard Conformance to the SOP Classes listed in the table below.

Table 2-53:
SOP Classes for MPPS

SOP Class Name	SOP Class UID	User of Service (SCU)	Provider of Service (SCP)
Supported MPPS SOP Classes

2.2.6.2.2 Number of Associations

Table 2-55:
Number of Associations as an Association Initiator for MPPS AE

Maximum number of simultaneous associations	Unlimited

2.2.6.2.3 Asynchronous Nature

The SC2000 supports asynchronous communication (multiple outstanding transactions over a single association). On the SCU side, the Window size proposed is infinite.

2.2.6.2.4 Implementation Identifying Information

Table 2-56:
DICOM Implementation Class and Version for MPPS AE

Implementation Class UID	1.3.12.2.1107.5.99.3.20080101
Implementation Version Name	SIEMENS

2.2.6.3 Association Initiation Policy

SC2000 initiates associations while processing the service operations and internal messages as shown below.

Operation or Real-World Activity	Association for
DIMSE N-CREATE, N-SET (forwarding MPPS)	N-CREATE, N-SET

2.2.6.3.1 Activity "Send MPPS"

2.2.6.3.1.1 Description and Sequencing of Activities

The SC2000 supports the DICOM Modality Performed Procedure Step Service as an SCU. The Modality Performed Procedure Step SCU informs the Performed Procedure Step SCP about the procedure performed at the modality using the N-CREATE and N-SET DIMSE service.

Immediately after a new patient, study, or scheduled procedure is registered (via Patient Registration), the SC2000 automatically performs an MPPS N-CREATE-RQ operation with a status of IN-PROGRESS for the newly created Performed Procedure Step. When the current patient procedure ends (either with an End Exam, or new Patient / Study / Procedure), the SC2000 automatically performs an MPPS N-SET-RQ final operation with a status of COMPLETED. The user may also manually complete or discontinue the current Performed Procedure Step. An MPPS N-SET-RQ final operation is performed with the appropriate status of COMPLETED or DISCONTINUED.

2.2.6.3.1.2 Proposed Presentation Contexts

Table 2-57:
Proposed Presentation Contexts for MPPS AE

		Explicit VR Little Endian	1.2.840.10008.1.2.1		
		Explicit VR Big Endian	1.2.840.10008.1.2.2		

There is no extended negotiation as an SCU.

2.2.6.3.1.3 SOP Specific Conformance to SOP classes

All Attributes listed in DICOM PS3.4 in Table F8.2-1 are potentially supported the SC2000**.** They will be part of the MPPS Message if set by the Application triggering the Service.

Refer to section 6.1.1, Created SOP Instances, for a detailed list of attributes.

Table 2-59:
DICOM Command Communication Failure Behavior

Exception	Behavior
Timeout	Failure reported to user
Association Aborted	Failure reported to user

2.2.6.4 Association Acceptance Policy

MPPS AE does not accept Association requests.

2.3 Network Interfaces

2.3.1 Physical Network Interface

The SC2000 is independent from the physical medium over which TCP/IP executes; it inherits this from the OS system upon which it executes.

2.3.2 Additional Protocols

None.

2.3.3 IPv4 and IPv6 Support

IPv4 supported, IPv6 not supported.

2.4 Configuration

DICOM and networking parameters can be configured for both the local SC2000 and remote DICOM Service Class Providers through the User Configuration – Networking/Printing pages.

2.4.1 Local Host - TCP/IP and General

The SC2000's local network parameters are configurable. The following parameters can be configured for the SC2000:

- Host Name
- IP address
- Network IP mask
- Router/Gateway IP addresses
- DICOM Storage and HIS/RIS SCU Application Entity Titles
- Printers

2.4.1.1 DICOM Storage Configuration

Remote DICOM Storage and Storage Commitment Service Class Providers are configured through the Store Configuration or Storage Commitment Configuration of the User Configuration – Networking/Printing pages. The following parameters can be configured for each device:

- Host name
- IP address
- AET - Application Entity Title
- Port number
- Proposed transfer syntaxes

2.4.1.2 DICOM HIS/RIS Configuration

Remote DICOM Worklist and Modality Performed Procedure Step Service Class Providers are configured through the RIS Server Configuration of the User Configuration – Networking/Printing pages. The following parameters can be configured for each Worklist/MPPS server:

- Host name
- IP address
- AET - Application Entity Title
- Port number
- Query waiting time (in seconds)
- Maximum number of matching results
- Automatic Worklist query interval (in minutes)
- Modality
- Scheduled Procedure Step Date
- Station Name

3 MEDIA INTERCHANGE

3.1 Implementation Models

3.1.1 Application Data Flow Diagram

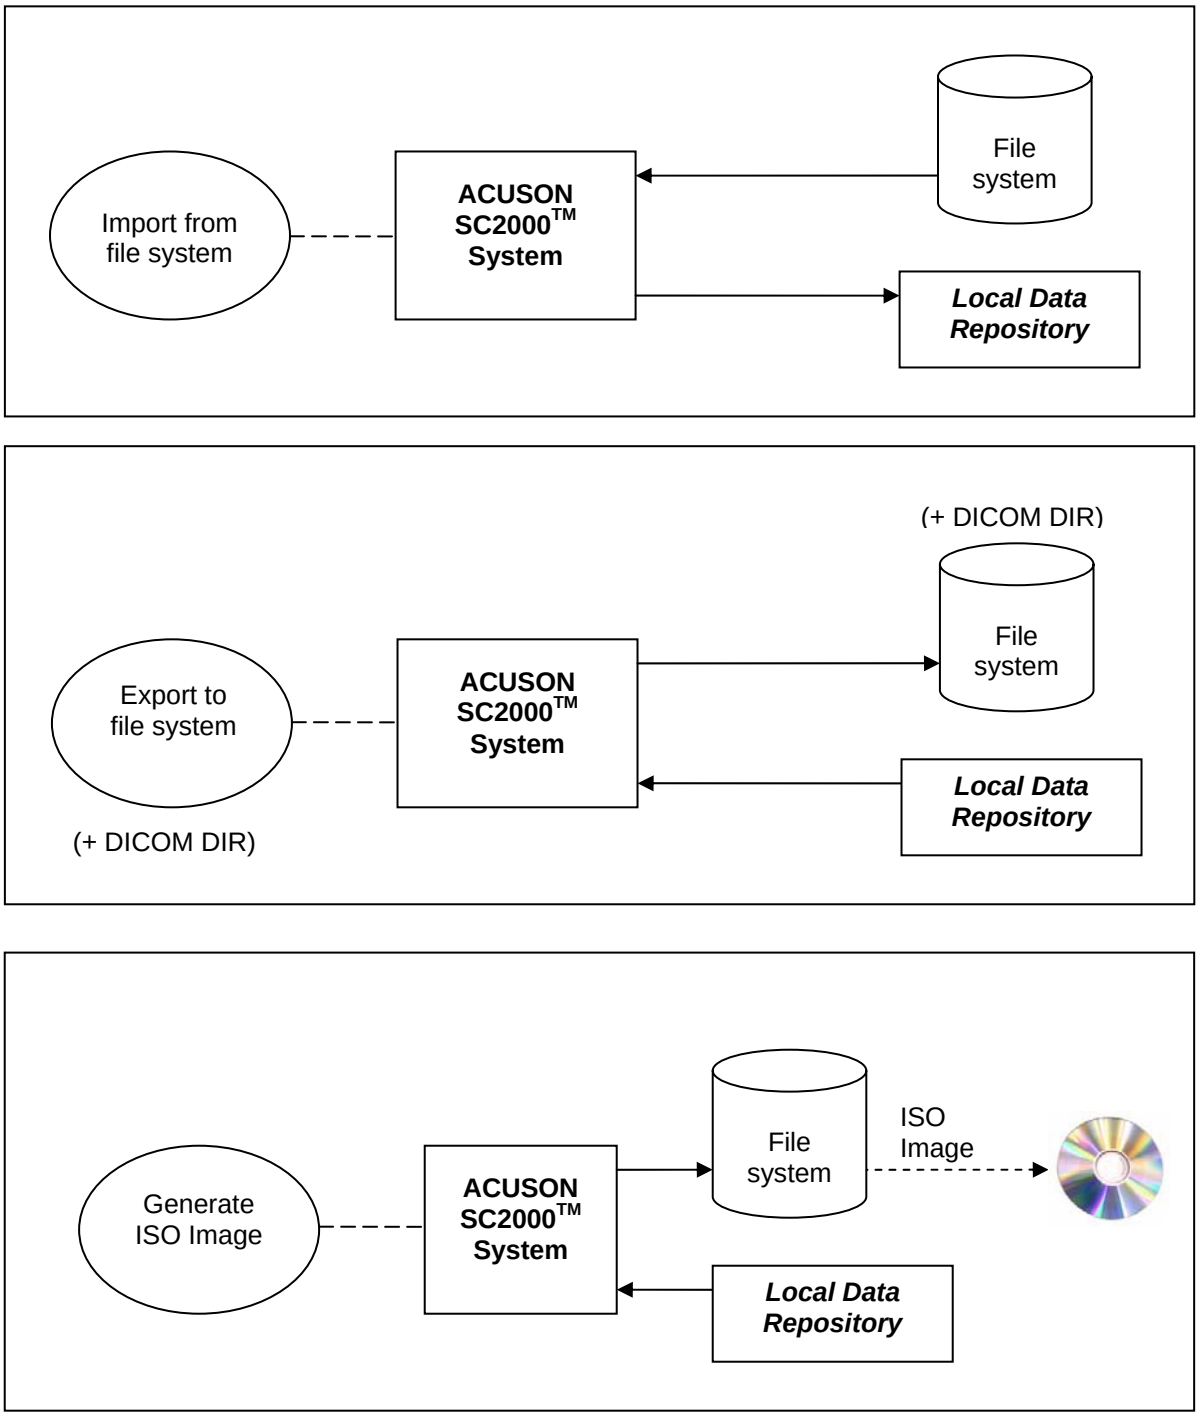

Figure 3-1. Media Application Data Flow Diagram

The SC2000 provides the functionality to Import or Export DICOM Instances to and from the File System. During exportation, a DICOMDIR may also be generated. A complete ISO Image ready-to-burn can be generated. All SOP Classes defined in Table 2-1: SOP Classes for Storage AE are supported for the Import/Export functionality.

3.1.2 Functional definitions of AEs

The SC2000 is capable of

- creating a new File-set in the File System (Export to ...)
- importing SOP Instances from the File System onto local storage

3.1.3 Sequencing of Real-World Activities

Not applicable.

3.1.4 File Meta Information for Implementation Class and Version

Table 3-1:

3.2 AE Specifications

3.2.1 Media Storage AE Specification

The SC2000 system Media Storage AE provides conformance to the following DICOM SOP Classes as an FSC. The following specifications apply to the AE.

When configuring an uncompressed Transfer Syntax, the STD-US and STD-GEN application profile classes will be extended to store instances of the following SOP classes in compressed format.

Table 3-2:

3.3.2 Compliance to STD-GEN-CDR

The SC2000 conforms to the STD-GEN-CDR profile. The following SOP Classes will be supported as an FSC.

Table 3-5:
STD-GEN-CDR Supported SOP Classes

IOD	SOP Class UID	Transfer Syntax and UID	FSC	FSR	FSU
Secondary Capture Image Storage	1.2.840.10008.5.1.4.1.1.7	Explicit VR Little Endian	Yes	No	No

3.3.3 Compliance to STD-US-SC-MF-CDR

For media conforming to the STD-US-SC-MF-CDR profiles the following SOP Classes and transfer syntaxes will be supported as an FSC.

Table 3-6:
STD-US-SC-MF-CDR Supported SOP Classes

IOD	SOP Class UID	Transfer Syntax and UID	FSC	FSR	FSU

The following Photometric Interpretations are supported by FSC:

- RGB - Ultrasound Image Storage only

- YBR_FULL_422 - Ultrasound Multi-frame Image Storage (Clips) only

3.3.4 Compliance to STD-US-ID-MF-CDR

For media conforming to the STD-US-ID-MF-CDR profiles the following SOP Classes and transfer syntaxes will be supported as an FSC.

4 SUPPORT OF CHARACTER SETS

4.1 Character Sets for ACUSON SC2000 System

The ACUSON SC2000 system supports the ISO 8859 Latin 1 (ISO-IR 100) character set.

5 SECURITY

5.1 Security Profiles

- PS 3.15 Annex F: Network Address Management Profiles: DHCP Client, DNS Client supported
- PS 3.15 Annex G: Time Synchronization Profiles supported

5.2 Association Level Security

It is possible to configure whether the DICOM Server will only answer to known AETs or to any AET.

5.3 Application Level Security

- For configuration and maintenance, the Service Technician must login with a separate password.

6.1.1.8 Query: C-FIND

The SC2000 DICOM Query/Retrieve SCU supports hierarchical queries with all mandatory search keys. The interactive querying of attributes on IMAGE level is not supported by the Query SCU. Though, retrieval of individual Objects is possible. The following table describes the search keys for the different query models that the SCU supports. Matching is either wildcard, which means that the user can supply a string containing wildcards, or universal, which means that the attribute is requested as return value.

7 APPENDICES

7.1 Appendix A: Echocardiography Structured Report

This appendix lists the DICOM Structured Report (SR) mappings used in the Cardiac Structured Reports of the ACUSON SC2000 system SR files.

The mappings follow the DICOM SR Template TID 5200: Echocardiography Procedure Report, as described in PS 3.16-2008 of the DICOM Standard, and are organized in a manner similar to TID 5200. The **Label** column identifies the on-screen worksheet label associated with a measurement using the format "[Worksheet] Table Heading: Measurement Label" or "[Worksheet] Measurement Label". All private code values use the Coding Scheme Designator "99SIEMENS".

[…] contains additional information about the measurement.

The **HR** column indicates if a measurement has an individual heart rate associated it. The heart rate is defined in the SR by HAS PROPERTIES, NUM, Heart Rate (LN, 8867-4) with VM of 1.

When a Simpson's Disk Number is associated with a volume as a modifier, it is defined in the SR by HAS CONCEPT MOD, TEXT, Simpson Disk Number (99SIEMENS, SimpsonDiskNum) with VM of 1.

Worksheets are identified in the Label column by the following notation:

Notation	Worksheet	Notation	Worksheet
[A]	Arteries	[PV]	Pulmonary Valve
[Ao]	Ao/Aortic Valve	[PVn]	Pulmonary Veins
[D]	Diastology	[RA]	Right Atrium
[LA]	Left Atrium	[RV]	Right Ventricle
[LR]	LVA/RVA	[SE]	Stress Echo-LVA
[LV]	Left Ventricle	[Sh]	Shunts
