

One fast, accurate scan for a wide range of patients.

Biograph mCT for PET•CT.

Biograph mCT is a PET•CT imaging system used to diagnose and monitor diseases such as cancer, heart disease, dementia and other neurological disorders. It provides accurate high-resolution images of the inside of your body.

Its advanced dose-reduction technologies and fast imaging times allow for a lower radiation dose and increased speed in comparison to other systems on the market. And because Biograph mCT features a wide opening and short tunnel, patients up to 500 lb can experience a more comfortable exam and may feel less claustrophobic.

You can be confident your physicians will receive precise information for more diagnostic certainty and more informed treatment planning.

Ask your physician how Biograph mCT can help in the diagnosis and treatment of your condition — in one fast, accurate exam.
