

Are they “senior moments” or something more?

Your physician may be able to help you get some answers.

New tests can help evaluate Alzheimer’s disease so you can plan for the best future possible.

There is currently no noninvasive test to determine if a person has Alzheimer’s or another type of dementia. But getting evaluated can offer patients more options for treatment and planning.

New brain imaging technologies using the Siemens’ Biograph mCT family of PET•CT scanners may help detect signs of Alzheimer’s disease: an abnormal build-up of protein deposits known as amyloid plaques.

Combined with other types of medical exams, the Siemens’ Biograph mCT family of PET•CT scanners can help evaluate patients for Alzheimer’s — so you and your loved ones have time to prepare for the best future possible.

Ask your physician about brain imaging with Biograph mCT — and start to plan your future.
