Intermediate disinfection

General Instructions
- While cleaning and disinfecting, wear gloves with chemical resistance.
- Always work from clean to dirty (top down) and from front to back.
- Always use a new wet wipe or mop.
- Use mops and sponges only as long as they show a closed liquid film.
- Dispose of used mops and sponges according to the instructions of your facility.
- This order only applies when using fast-acting surface disinfectants. For longer exposure times, it may be useful to first disinfect the surfaces near the patient and then the distant ones.

Preparation Steps
- Prepare the C-arm, patient table and control units.

Start of disinfection
- Visual inspection of all surfaces on the C-arm, C-arm chassis as well as all surfaces of the monitor cart for visible contamination.
- Perform with targeted wipe disinfection of soiled areas.
  a) Monitor cart: display, mouse and handles
  b) Mobile-C-arm: handles
  c) Mobile-C-arm: handswitch
  d) Mobile-C-arm touch user interface/remote user interface
  e) Remote control dock
  f) Mobile-C-arm: ID from top, front to bottom
  g) Mobile-C-arm FD (front)
  h) Mobile-C-arm ED (bottom)
  i) C-arm inner surface
  j) C-arm single tank from top to bottom
  k) If possible, lift C-arm vertically with motorisation
  l) Wireless footswitch

Terminal disinfection

General Instructions
- The surfaces in the OR must be completely dry before entering.

Continue disinfection
- Use pre-soaked mops for disinfect of the floor

End of disinfection
- Use pre-soaked mops for disinfect of the floor

Cios Spin, Cios Alpha & Cios Flow – Clean Guide · 06.2021
Clean Guide – Improve infection control

Purpose of this document
This CleanGuide is a non-binding recommendation developed jointly by Siemens Healthineers and ECOLAB on how to clean and disinfect the Cios mobile C-arm, and is intended both for intermediate and terminal cleaning. Adaptations due to application- or region-specific requirements need to be considered, as well. This document contains information specific to ECOLAB and Siemens Healthineers. Please also observe the individual product information in the operator manual.

Indications and caution
Antibiotic-resistant pathogens are not characterized by a higher resistance to disinfectants. A patient’s infection status (e.g., “septic” patients with chronic viral disease like HIV and hepatitis or patients with multi-resistant pathogens like MRSA and MRGN) does not necessarily indicate:
- changes to the intermediate disinfection of the treatment rooms and ORs or
- an extension of the contact time: extra wetting of the surfaces is not necessary.

All surfaces in the treatment rooms and ORs must be completely dry before the rooms can be entered or used! In the case of acute infectious diseases with non-enveloped viruses or spores, the standard disinfection process must be adjusted (see recommended materials).

Caution:
- Do not let cleaning liquids seep into the openings of the system, e.g., air openings, gaps between covers.
- Use only recommended materials for cleaning and disinfection.

Recommended materials
In this paragraph, we distinguish between material used to disinfect the Cios mobile C-arm, and those used to disinfect the floor directly surrounding the mobile C-arm:

ECOLAB® Incidin® OxyWipes | ECOLAB® Incidin® OxyFoam | ECOLAB® Incidin® Pro 0.5 impregnated mops & dry wipes
1. Preparation

Disinfection of the floor in the direct environment of the mobile C-arm: An adequate number of mops must be prepared as needed for use (according to the dilution instructions for Incidin® Pro, and the instruction for impregnation of mops at your facility).

Surface disinfection of the mobile C-arm:
• The buckets of Incidin® Dry Wipes for disinfection of surfaces must be filled with Incidin Pro 0.5%.
• Incidin® OxyWipes must be on hand.

While cleaning and disinfecting, wear gloves with chemical resistance.
• Always work from top to bottom (top down) and from clean to dirty areas.
• After removing blood, discard the wet wipe or mop. Use a new one to continue cleaning.
• Use mops and wipes only as long as they leave a closed liquid film on the surface.
• Dispose of used mops and wipes according to the instructions of your facility.

The OR nurse determines when to start any intermediate disinfection. If necessary, the OR staff can give instructions to remove drapes from areas further away from the patients (e.g., C-arm) and disinfect those while the patient is present in the OR.

The mobile C-arm should be moved to the edge of the operating room. If the patient is still in the operating room, the disinfection of the mobile C-arm must not take place directly in the vicinity of the patient. Afterwards the drapes should be carefully removed and disposed of, to reduce the risk of contamination (when removing, turn inwards and make sure that any remaining liquids, etc., are not distributed during disposal. If used, remove the drapes from C-arm, patient table and control units.)
2. Intermediate disinfection

If there is visible soiling of the floor: disinfect the floor below and directly around the mobile C-arm. Visual inspection of all surfaces on the C-arm, C-arm chassis as well as all surfaces of the monitor cart for visible contamination. Proceed with targeted wipe disinfection of soiled areas before starting the actual surface disinfection workflow. Use wet or impregnated dry wipes to disinfect the following surfaces, in the following order:

- a) Monitor cart: display, mouse and handles
- b) Mobile C-arm: handles
- c) Mobile C-arm: handswitch
- d) Mobile C-arm touch user interface/remote user interface
- e) Tableside docking for remote control unit
- f) Mobile C-arm: FD from top, front to bottom
- g) Mobile C-arm FD (front)
- h) Mobile C-arm FD (bottom)
- i) Mobile C-arm FD (bottom)
- j) Mobile C-arm: single tank from top to bottom
- k) If possible, lift C-arm vertically with motorisation.
- l) Wireless footswitch
- m) Fins below the horizontal unit of the C-arm
- n) Lifting column of the C-arm
- o) Mobile C-arm: outer rail surfaces and cabling
- p) C-arm: inner surface
- q) C-arm: single tank from top to bottom
- r) C-arm: inner surface
- s) Mobile C-arm: outer rail surfaces and cabling

Use the impregnated mops to disinfect the floor work from clean to dirty areas. The surfaces in the OR must be completely dry before the next usage. In addition, the residence time before use is to wait until dry.

Note: The following workflow is based on the availability of fast-acting surface disinfectants and therefore works strictly from clean to dirty. If disinfectants with longer residence times are used, it may make sense for reasons of infection prevention to first disinfect surfaces near the patient and then the distant surfaces.

3. Terminal disinfection of the mobile C-arm

The terminal disinfection procedure differs in some respects from intermediate disinfection. The most important change is that on C-arm main unit and the monitor cart, all surfaces get wipe-disinfected. The sequence of disinfection work remains unchanged.

- a) Monitor cart: display, mouse and handles
- b) Mobile C-arm: handles
- c) Mobile C-arm touch user interface/remote user interface
- d) Mobile C-arm touch user interface/remote user interface
- e) Tableside docking for remote control unit
- f) Mobile C-arm: FD from top, front to bottom
- g) Mobile C-arm FD (front)
- h) Mobile C-arm FD (bottom)
- i) Mobile C-arm FD (bottom)
- j) Mobile C-arm FD (bottom)
- k) If possible, lift C-arm vertically with motorisation.
- l) Wireless footswitch
- m) Fins below the horizontal unit of the C-arm
- n) Lifting column of the C-arm
- o) Mobile C-arm: outer rail surfaces and cabling
- p) C-arm: inner surface
- q) C-arm: single tank from top to bottom
- r) C-arm: inner surface
- s) Mobile C-arm: outer rail surfaces and cabling
- t) Mobile C-arm: outer rail surfaces and cabling

4. Cleaning

To ensure good hygiene practice, preserve material integrity, long-term and avoid any build-up of residues, a regular cleaning step is required. This cleaning step is important, no matter whether cleaner-disinfectants or just disinfectants are used for disinfection. A cleaner-disinfectant enables a one-step process in most cases, pre-empting a cleaning step preceding each disinfection step. However, use of a cleaner-disinfectant does not replace a regular cleaning process. If the mobile C-arm is used heavily, a weekly cleaning procedure of all regularly disinfected surfaces is strongly recommended.

Use the impregnated mops to disinfect of the floor work from clean to dirty areas. The surfaces in the OR must be completely dry before the next usage. In addition, the residence time before use is to wait until dry.

The terminal disinfection procedure differs in some respects from intermediate disinfection. The most important change is that on C-arm main unit and the monitor cart, all surfaces get wipe-disinfected. The sequence of disinfection work remains unchanged.

- a) Monitor cart: display, mouse and handles
- b) Mobile C-arm: handles
- c) Mobile C-arm touch user interface/remote user interface
- d) Mobile C-arm touch user interface/remote user interface
- e) Tableside docking for remote control unit
- f) Mobile C-arm: FD from top, front to bottom
- g) Mobile C-arm FD (front)
- h) Mobile C-arm FD (bottom)
- i) Mobile C-arm FD (bottom)
- j) Mobile C-arm FD (bottom)
- k) If possible, lift C-arm vertically with motorisation.
- l) Wireless footswitch
- m) Fins below the horizontal unit of the C-arm
- n) Lifting column of the C-arm
- o) Mobile C-arm: outer rail surfaces and cabling
- p) C-arm: inner surface
- q) C-arm: single tank from top to bottom
- r) C-arm: inner surface
- s) Mobile C-arm: outer rail surfaces and cabling
- t) Mobile C-arm: outer rail surfaces and cabling

4. Cleaning

To ensure good hygiene practice, preserve material integrity, long-term and avoid any build-up of residues, a regular cleaning step is required. This cleaning step is important, no matter whether cleaner-disinfectants or just disinfectants are used for disinfection. A cleaner-disinfectant enables a one-step process in most cases, pre-empting a cleaning step preceding each disinfection step. However, use of a cleaner-disinfectant does not replace a regular cleaning process. If the mobile C-arm is used heavily, a weekly cleaning procedure of all regularly disinfected surfaces is strongly recommended.
